What is Hepatitis C?
Hepatitis C is a virus that causes the liver to become inflamed. Over many years, hepatitis C can lead to serious liver damage.

There are a number of different types of Hepatitis C throughout the world.

There are about 170 million people infected with Hepatitis C worldwide.

Hepatitis C is passed on through blood-to-blood contact only. For example you can be exposed to the virus through sharing equipment for injecting illegal drugs like heroin, unsterile medical procedures or unsterile tattooing or piercing.

Symptoms of Hepatitis C
Hepatitis C can cause a number of symptoms they include:
- Flu-like symptoms
- Fatigue
- Pain or discomfort of the liver
- Weight loss/poor appetite
- Skin conditions
- Change in mood
- Muscle aches and pains

HEPATITIS C CAN BE DIAGNOSED THROUGH A SIMPLE BLOOD TEST ORDERED THROUGH YOUR DOCTOR.

Treatment for Hepatitis C
Hepatitis C can be treated with medication. It involves having an injection under the skin once a week and tablets every day. Treatment may be for 6 months or one year depending on the type of Hepatitis C. There is a 50%-80% chance of clearing the virus from your system after treatment.

LIFESTYLE CHANGES TO PREVENT FURTHER LIVER DAMAGE
- Maintain a healthy diet (drink plenty of water)
- Reduce or stop alcohol intake
- Avoid medications that may cause further damage to your liver
- Get plenty of rest
